

DROP SPAN

MAXIMIZE AND INCREASE THE IRRIGATED AREA

RKD Drop Span is a system that allows to maximize and increase the irrigated area in irregular or obstructed parcels.

In a few minutes it allows you to disconnect and connect the sections necessary to get rid of the irregularities of the terrain, leaving the rest of the machine with all its functionalities. It has retractable legs that allow the towers to be disconnected at their normal height from the ground.

It is available for center pivots and lateral systems, on all **RKD** models. In addition, several units can be installed on the same machine.
