SWING OVERHANG

## RKD<sup>®</sup> REVOLVING OVERHANG

RKD in its constant effort for the development of new products that allow us to improve and in this particular case, increase the area irrigated with our pivots, especially in those areas that due to their special characteristics where there are obstacles (such as: houses, posts, forests, etc.), which we could not reach before, because they did not allow the passage of a normal overhang. RKD has developed the swivel overhang, which is collected in those areas through which it cannot pass, redeploying after saving the obstacle.

The RKD swivel overhang has a maximum length of 30.6 m. And it can be used in all RKD models from diameter 596 (5 9/16" -141.3mm)

Its operation is automatic from the center of the pivot, avoiding obstacles on the field.

Furthermore we can install 2 end guns, first one installed on extended overhang, and the second one, for the option with the collected overhang, allowing to maximize irrigation areas.
